

**IS5152 Data-driven Decision Making**  
**SEMESTER 2 2023-2024**  
**Assignment 1**

- Upload a softcopy of your solution as a **pdf** document to Canvas.
  - Deadline: 11.59 pm, Friday, 9 February, 2024.
- 

1. (10 points) A company manufactures two products (1 and 2). Each unit of product 1 can be sold for \$15, and each unit of product 2 for \$25. Each product requires raw material and two types of labor (skilled and unskilled) as shown in the table below:

	Product 1	Product 2
Skilled labor	3 hours	4 hours
Unskilled labor	2 hours	3 hours
Raw material	1 unit	2 units

At present, the company has available 100 hours of skilled labor, 70 hours of unskilled labor, and 30 units of raw material. Because of marketing considerations at least 3 units of product 2 must be produced.

- Let  $x_1$  and  $x_2$  be the number of units of product 1 and product 2 to be produced, respectively. Formulate a linear program to maximize total revenue.
  - Show that the best production level is  $x_1 = 24$  and  $x_2 = 3$  by checking that all the necessary and sufficient conditions are satisfied.
  - How much would the company be willing to pay for an additional unit of each type of labor?
  - What would the company's revenue be if 90 hours of skilled labor were available?
  - State the dual of the linear program from part (a). What is the solution of this dual linear program?
2. (10 points) Find the solution of the quadratic programming problem:

$$\min 2x_1^2 - x_2$$

subject to

$$2x_1 - x_2 \leq 1$$

$$x_1 + x_2 \leq 1$$

$$x_1, x_2 \geq 0$$

Show that all the necessary and sufficient optimality conditions are satisfied. Explain why the objective function is convex.

3. (10 points) The ABC Company produces two products. The total profit achieved from these products is described by the following equation:

$$\text{Total profit} = -0.1X_1^2 - 0.2X_2^2 + 8X_1 + 12X_2 + 1500$$

where

$X_1$  = thousands of units of product 1.

$X_2$  = thousands of units of product 2.

Every 1000 units of product 1 require one hour of time in the shipping department, and every 1000 units of product 2 require 30 minutes in the shipping department. Each unit of either product requires one pound of a special ingredient, of which 55000 pounds will be available in the next production period. Additionally, 80 hours of shipping labor will be available in the next production period. Demand for both products is unlimited.

- (a) Formulate a quadratic programming (QP) model to maximize the total profit.
- (b) Use the KT conditions to find a solution of this QP.
- (c) What is the maximum total profit?
- (d) What conditions are required on the objective function and the constraints to guarantee that the solution found in (b) results in maximum profit? Are these conditions satisfied?
